HolidayJug: Stage 1 Website Requirements

For: Development and API team | Owner: Vivek Babu Jujjavarapu | Website: holidayjug.com | Version 1.2, 22 October 2026

1. Purpose and Stage 1 scope

Customers search on the website and see a price online. They do not book online. To book, they call the HolidayJug UK sales line. Every search gets a Search ID. When the customer calls, the agent uses a basic internal tool to find the search by its ID, see what the customer searched and selected, and check the live price.

Order of the customer journey, which is also the order of this document:

- Visit the site: global rules (section 2) and homepage (section 3)
- Search: destinations, flights and pricing (sections 4 to 6)
- Results show the price and a Search ID (section 7)
- Customer calls; agent looks up the ID and checks the live price (section 8)
- Destination list, developer notes and launch order (Appendix A)

2. Global requirements (every page)

ID	Requirement
G1	**Sales number clearly visible.** Show the UK sales line (0330 165 8879) in the header of every page, tap-to-call on mobile, kept visible when scrolling on mobile, and repeated in the footer, on search results and on every hotel or flight detail page.
G2	**"Call for hidden prices" banner and popup.** Show a banner with the text "Call for hidden prices" and the sales number in every sensible position: a bar on all pages, an inline banner on the homepage, destination pages, search results, hotel and flight pages. Also show a popup (time-delayed, and on exit intent on desktop). Every popup must be easy to close, must not block the whole screen on mobile, and once closed must not reappear for the rest of that visit.
G3	**Every page has real content.** No empty pages, no placeholders (for example "£XX" prices), and no page that redirects to unrelated content. A page with no content must be removed from menus and links. Broken links go to the closest relevant page. Destinations with no hotels mapped are hidden from search and menus.
G4	**Social buttons go to the real pages.** Facebook, Instagram and YouTube buttons must open the actual HolidayJug page (handle: holidayjug) in a new tab, not the website homepage and not the platform's own homepage. The owner will supply the exact URLs.
G5	**Footer logos.** Add the IATA and ATOL logos at the bottom of the site. No separate ATOL page is needed.
G6	**Legal pages.** Terms and Conditions, Privacy Policy, Cookie Policy, Complaints and Booking Conditions stay as they are now, linked from the footer on every page.

3. Homepage: Hot Deals banner

ID	Requirement
H1	Remove the current Deals section from every page.
H2	Replace it with one banner titled "Hot Deals" on the homepage, made of scrolling slides (auto-advance, swipe on mobile, pause on touch or hover).

ID	Requirement
H3	Slides are managed from one place in the admin area so a change appears everywhere at once. Each slide has an image, a destination, a "from" price and a link to a relevant search or destination page. The "from" price must be a genuinely available price. Suggested maximum: 6 slides.

4. Destinations and search

Decision for the API team: HolidayJug maintains its own destination list, and the developer maps the supplier's hotels and resorts against it. Reasons: UK customers search by holiday area (Majorca, Costa del Sol, Algarve), not by supplier city; supplier lists use different spelling and are city-based; the website stays independent of the supplier; and empty destinations can be hidden. We have one supplier API at launch, so only that supplier's hotels need mapping.

ID	Requirement
D1	The master list has two fields only: **Country** and **Customer search destination**. The full list is in Appendix A.
D2	Each supplier hotel or resort maps to exactly one customer search destination.
D3	Search inputs: departure airport, destination, dates or duration, number of rooms, adults and children per room (with children's ages). Departure airports are a separate list (see Appendix A.4).
D4	**The search must be a comprehensive search:** it returns all the hotels, room types and board options the supplier has available for the customer's search, not a partial or limited set.
D5	Notes for the developer and the launch order are in Appendix A.4 and A.5.

5. Flights integration

ID	Requirement
F1	Connect a flight data source that returns the live airline fare with no margin or mark-up added. Flights can be shown on their own or bundled with a hotel.
F2	The developer must confirm, before building, that the chosen provider (a) lets HolidayJug use its prices on its own site, (b) returns a fare that HolidayJug can actually book or ticket, and (c) is available to a business of our size. Skyscanner's travel API is partner-gated and mainly designed for comparison sites that send customers to book elsewhere, so it may not meet (a) to (c). Other providers to evaluate (examples only, not recommendations): Amadeus, Duffel, Kiwi and the supplier's own flight inventory.
F3	The flight price shown is the fetched fare converted to GBP, with no default margin added (see section 6).
F4	**Currency.** Convert INR to GBP at a current market rate. Google and XE do not offer free official APIs and their pages must not be scraped, so use a licensed rates API (for example XE's paid API). Store the rate used and the time it was fetched with every price.

6. Pricing rules

ID	Requirement
P1	**True margin on the selling price**, not a mark-up: selling price = cost / (1 - margin). Example: hotel cost 100.00 at 13% gives 114.95.
P2	**The default margin is 13% and applies to the hotel price only.** The rate is a setting in the admin area.
P3	Flights, transfers and other add-ons carry no default margin on the website. Agents pitch them to customers on the call to generate profit. When a hotel is bundled with flights, transfers or add-ons, the bundle total is the sum of the parts: the hotel price (including the 13% margin) plus the flight and add-on prices.

ID	Requirement
P4	**Local taxes.** Taxes that would normally be paid at the hotel (for example resort or tourist tax) must be displayed as a separate line, and must be included in the total price, so the customer is never asked to pay anything at the hotel.
P5	Calculate prices on the server only. The supplier's net price must never be sent to the browser. Use one function for every page: search results, hotel and flight pages, "from" prices and the deals banner. Round up to the penny.
P6	For every search result, store: supplier cost, margin rate, selling price, currency rate used (where applicable), and the times each was fetched.

7. Search ID

ID	Requirement
S1	Every search generates a unique Search ID, short and easy to read over the phone (for example 8 characters, with no easily confused letters and numbers such as O and 0). It must not be guessable.
S2	Show the Search ID on the results page, with a copy button and the message "Quote this ID when you call us" next to the sales number.
S3	Save with each Search ID: the customer's search details (destination, departure airport, dates, rooms, adults, children and ages); the hotel, room type, board basis and any flights shown; the price displayed to the customer; supplier cost, margin and currency rate; the **time the search was generated**; and the **time the price was fetched from the database**.
S4	Record and show all times in UK time. Keep personal data to a minimum and keep search records for 30 days (adjustable setting).
S5	*Suggestion:* show "Price checked at [time], subject to availability" beside every price on the website.

8. Agent tool (internal, basic)

A simple internal page. Keep it basic: its job is to show the agent what the customer searched and selected, and to check the live price.

ID	Requirement
A1	Simple login for agents.
A2	A box to enter the Search ID. An invalid or expired ID shows a clear message.
A3	Show what the customer searched: destination, departure airport, dates, number of nights, number of rooms, adults and children in each room, and the children's ages.
A4	Show what the customer selected: hotel, room type, board basis, any flights, transfers or add-ons, and the price shown (hotel price, local tax as a separate line, and the total).
A5	Show **Search generated at**, **Price fetched from database at** and the current time, with the gap in hours and minutes.
A6	A "Check live price" button that re-runs the same search with the supplier and shows the live price next to the price the customer saw, with the difference. The agent explains any change to the customer.

A. Appendix: Destination list, developer notes and launch order

A.1 Core destinations (launch first)

Country	Customer search destination
Spain	Majorca
Spain	Menorca
Spain	Ibiza
Spain	Costa del Sol
Spain	Costa Blanca
Spain	Costa Brava
Spain	Costa Dorada
Spain	Costa de Almeria
Spain	Barcelona
Spain	Madrid
Spain	Seville
Spain	Valencia
Canary Islands	Tenerife
Canary Islands	Lanzarote
Canary Islands	Fuerteventura
Canary Islands	Gran Canaria
Canary Islands	La Palma
Turkey	Antalya
Turkey	Side
Turkey	Alanya
Turkey	Belek
Turkey	Kemer
Turkey	Dalaman
Turkey	Marmaris
Turkey	Fethiye
Turkey	Bodrum
Turkey	Kusadasi
Turkey	Istanbul
Greece	Crete
Greece	Rhodes
Greece	Corfu

Country	Customer search destination
Greece	Kos
Greece	Zante
Greece	Kefalonia
Greece	Halkidiki
Greece	Santorini
Greece	Mykonos
Greece	Skiathos
Greece	Athens
Portugal	Algarve
Portugal	Madeira
Portugal	Lisbon
Portugal	Porto
Cyprus	Paphos
Cyprus	Ayia Napa
Cyprus	Protaras
Cyprus	Larnaca
Cyprus	Limassol
Egypt	Hurghada
Egypt	Sharm El Sheikh
Egypt	Marsa Alam
Egypt	Cairo
United Arab Emirates	Dubai
United Arab Emirates	Abu Dhabi
United Arab Emirates	Ras Al Khaimah

A.2 Secondary destinations (add after launch)

Country	Customer search destination
Malta	Malta
Italy	Sicily
Italy	Sardinia
Italy	Amalfi Coast
Italy	Rome
Italy	Venice
Italy	Lake Garda

Country	Customer search destination
Croatia	Dubrovnik
Croatia	Split
Croatia	Hvar
Croatia	Istria
Bulgaria	Sunny Beach
Bulgaria	Golden Sands
Morocco	Marrakech
Morocco	Agadir
Tunisia	Djerba
Tunisia	Hammamet
Cape Verde	Sal
Cape Verde	Boa Vista

A.3 Long-haul destinations

Country	Customer search destination
United States	Orlando
United States	Miami
United States	Fort Lauderdale
United States	Tampa and Clearwater
United States	Las Vegas
United States	New York
United States	Los Angeles
Mexico	Cancun
Mexico	Riviera Maya
Mexico	Playa del Carmen
Mexico	Tulum
Dominican Republic	Punta Cana
Jamaica	Montego Bay
Jamaica	Negril
Barbados	Barbados
Cuba	Varadero
Maldives	Maldives
Mauritius	Mauritius
Thailand	Phuket

Country	Customer search destination
Thailand	Koh Samui
Thailand	Krabi
Thailand	Bangkok
Indonesia	Bali
India	Goa
India	Kerala
India	Delhi
India	Jaipur

Goa, Kerala, Delhi and Jaipur are included for UK-India corridor customers.

A.4 Notes for the developer

- Canary Islands are technically Spain, but UK sites show them as their own group. Keep the display group separate.
- Store search aliases: Majorca/Mallorca, Zante/Zakynthos, Sharm/Sharm El Sheikh.
- Hide any destination with no hotels mapped yet.
- Match hotels by name plus coordinates and review mismatches manually.
- Departure airports are a separate list (Gatwick, Heathrow, Luton, Stansted, Manchester, Birmingham, Bristol, Edinburgh, Glasgow).
- Resort level (Benidorm, Salou, Magaluf, Albufeira) can be added later as a third level.

A.5 Launch order

1. Load the core destinations and aliases.
2. Map the API supplier's hotels to our destinations.
3. Check search shows only destinations with hotels and live prices.
4. Add secondary and long-haul destinations once the core list is stable.
